Introduction to Twinning

The rapid cross continental spread and wide occurrence of major animal diseases, such as highly pathogenic avian influenza (HPAI), bluetongue and foot and mouth disease has highlighted the need for a global approach to Transboundary Animal Disease (TAD) diagnostics, surveillance, and control. It is clear that, with the current levels of global movements and trade, an outbreak of a TAD – in any one country - can be a threat to the whole international community. Successful containment and control of TADs and widely disseminated diseases will only be achieved through a global rapid response.

For control to be effective it is essential that, through accurate diagnosis, disease is detected early, promptly reported to the international community, and that standardised, internationally approved control measures are applied appropriately with minimum delay.

Accurate and early disease detection allows measures to be implemented at a time when the disease situation is more amenable to control, ensuring that resources are used more efficiently and that direct losses are kept to a minimum. Early warning of a possible risk situation allows neighbouring regions to be vigilant and ultimately reduces the risk of further disease spread.

On a regional level, early detection and effective control depends on access to expertise and reliable laboratory diagnostic facilities. On a global scale there is a need for such facilities and expertise to be distributed evenly so that all countries and territories can readily access it.

To allow safe trade in animals and animal products, trading countries must have confidence in surveillance programmes and testing regimes used to support claims of disease freedom. This requires expertise and reliable internationally approved diagnostic procedures and tests.
International standards and guidelines for the control, detection and diagnosis of major animal diseases are developed and set by the OIE on the basis of scientific principles. This supports the requirement of the Sanitary and Phytosanitary Agreement of the World Trade Organisation (WTO) that ‘sanitary measures should be scientifically justifiable’. All Members of the OIE are obliged to comply or move towards compliance with these international guidelines and standards that are prescribed in the OIE Codes and Manuals for terrestrial and aquatic animals. The standards for diagnostic tests are laid down in both the Terrestrial and Aquatic Diagnostic Manuals. OIE Reference Laboratories uphold these and act as centres of expertise for specific diseases, whereas OIE Collaborating Centres are centres of expertise in a specific designated sphere of competence (for example epidemiology, risk analysis, etc.). OIE Standards are continually reviewed, through debate, and then adopted by consensus of the International Committee at the OIE General Session each year.

Through the strength of their veterinary services, Members of the OIE need to be scientifically competent and have sufficient capacity to:

- Debate the scientific justification for standards on an equal footing with other Members.
- Where appropriate, conduct risk analyses as a basis for establishing and justifying national policies.
- Readily apply the guidelines and standards.

At present the expertise and diagnostic capacity provided through Reference Laboratories is located mainly in developed countries. This bias leads to a geographical distribution favouring the northern hemisphere. There is a need for a more even spread both in terms of geography and countries’ development status.

Capacity and expertise needs to be extended to developing and in-transition countries so that they can become self-sufficient in effective surveillance and control, and able to provide reliable evidence to certify animals and animal products as ‘safe for trade’.

**Twinning**

Twinning essentially involves creating and supporting a link that facilitates the exchange of knowledge, ideas and experience between two parties. It has been adopted by the OIE as a method for improving laboratory capacity and expertise in developing and in-transition countries.

A recent example of the successful application of Twinning on a large scale was the European Union (EU) enlargement programme. Over 1000 Twinning projects were implemented to assist accession countries in meeting and maintaining the standards required for entry into the EU.

The OIE laboratory Twinning programme will create opportunities for developing and in-transition countries to develop scientifically competent laboratory diagnostic methods and progress towards meeting the standards of the OIE. This will be achieved through individual Twinning projects. The eventual aim is to create more OIE Reference Laboratories in areas that are currently under-represented.

Although the ultimate aim is for Candidate Laboratories to reach OIE Reference status, it is acknowledged that this will be beyond the scope of some projects. In such cases, Twinning will bring the laboratory closer to OIE Reference Laboratory status by improving standards in specific selected areas.

Each Twinning project is a partnership between an OIE Reference Laboratory (or an OIE Collaborating Centre demonstrating specific laboratory expertise to OIE standards) and a Candidate Laboratory. The Reference Laboratory provides the Candidate Laboratory with technical support, guidance and training.

Objectives for each Twinning project are jointly agreed by the OIE and the two participants. The guiding or parent OIE Reference Laboratory and its designated expert will be the driving force, ensuring the success of the project. The flow of expertise would favour the Candidate Laboratory, but the relationship should be mutually beneficial. Links should be formed between staff at all levels.

The concept should be flexible and adaptable to a range of situations, from, as a first step, helping to report reliable diagnostic results to eventually achieving the level required to become an OIE Reference Laboratory. Twinning aims to harmonise procedures but not necessarily replicate them and needs to be adapted to existing systems in the Candidate Laboratory.

The benefits from the Twinning project should be sustainable, remain long after the project has closed and lead to the maintenance and further development of expertise in the region. Ideally the relationship between the two laboratories should be a long and lasting one.

To increase the chances of success the project should focus on limited, well defined, achievable
and measurable outputs. Clear-set benefits are realised throughout the project allowing it to be divided into stages with set outputs from each stage. Progress can be monitored through achievement of these goals.

The World Fund for Animal Health and Welfare, managed by the OIE and supported by donors, will provide financial support for Twinning projects. This is to support and sustain the link between the two participating laboratories for the duration of an approved project and ensure an effective transfer of expertise and capacity to the Candidate Laboratory. It is not an objective of Twinning to fund the purchase of laboratory hardware. However, the Twinning project may include an assessment of the needs for such hardware, so that other resources – beyond those provided for Twinning – can be allocated appropriately.

Twinning is part of the wider OIE initiative to improve the capacity of Veterinary Services in developing countries; it therefore has synergy with the OIE Performance of Veterinary Services (PVS) programme.

OIE Standards

OIE Standards are recognised by the World Trade Organization as reference international sanitary rules and are laid down in four texts: the Terrestrial Animal Health Code, the Manual of Diagnostic Tests and Vaccines for Terrestrial Animals, the Aquatic Animal Health Code and the Manual of Diagnostic Tests for Aquatic Animals. The Codes relate to rules that Members can use to protect themselves from the introduction of diseases and pathogens via trade, without setting up unjustified sanitary barriers. The OIE standards for laboratory testing and vaccination of terrestrial and aquatic animals are laid out in the Manuals.

Early, rapid and accurate detection of disease followed by immediate reporting to the international community are primary and essential steps for effective control of TADs. For most OIE listed diseases, clinical diagnosis alone is not sufficient to confirm infection in animals. Reliable laboratory diagnostics are therefore essential for disease control and safe trade.

Assurances about the quality and validity of laboratory results can be provided when laboratories comply with OIE Standards. These Standards also ensure international harmonisation of laboratory diagnostic techniques; they are upheld by OIE Reference Laboratories.

OIE Reference Laboratories are designated to pursue all the scientific and technical problems relating to surveillance and control of a named disease on the OIE list. The Expert, responsible to the OIE and its Members with regard to these issues, should be a respected and active scientist. The Reference Laboratory provides scientific and technical assistance, advice and training for OIE Member laboratories. They may also coordinate scientific and technical studies in collaboration with other laboratories or organisations (see OIE Mandate and Internal Rules for Reference Laboratories available on the OIE website at http://www.oie.int/eng/OIE/organisation/en_LR.htm?e1d8.

OIE Collaborating Centres are centres of expertise in a specific designated sphere of competence (for example epidemiology, risk analysis, etc.).

Scope of the Twinning project

The scope of subjects covered by Twinning is wide; objectives of individual projects may range from improving capacity in a specific technical area to improving capacity for a group of diseases. For example, one laboratory may have a requirement for improving its capacity to sequence avian influenza type A viruses, whilst another laboratory may wish to improve its pig viral diagnostics. The project should always be relevant to the needs of the area/region in which the Candidate Laboratory is situated. The length of the project will depend on the project’s scope; OIE Twinning projects have a minimum duration of 1 year and a maximum of 3 years.

To maximise the impact of the project it is important to select realistic, achievable objectives where significant improvements can be made. Choosing objectives that are too ambitious will introduce a risk of project failure and may further reduce the operational performance of a laboratory. It is important to focus on improving specific techniques within the Candidate Laboratory’s technological capability. This will form a solid platform on which to build.

Although some Twinning projects will result in the Candidate Laboratory reaching OIE Reference Laboratory status, this will not be possible or advisable in all cases. In some cases Candidate Laboratories may attain OIE Standards only in specific areas of work, for example a limited range of diagnostic tests.
Principles for selecting Parent and Candidate Laboratories

The success of a Twinning project depends on the selection of appropriately matched laboratories and well defined achievable objectives.

The project relies on the support and governance of National Veterinary Services. It is essential that the Delegates overseeing the two laboratories involved and the respective laboratory Directors support and agree to such a Twinning arrangement.

Twinning aims to expand the OIE Laboratory network of expertise to areas where there is a need. The need may be influenced by the disease situation, features of animal production systems in that area, or it may be based on a risk assessment. Candidate Laboratories should be in a region where expertise and capacity is currently deficient.

A tried and tested relationship has a good chance of being sustainable and successful. Twinning between laboratories that already have a good relationship should be encouraged.

A Parent Laboratory must have the required level of expertise and capacity relevant for the Twinning project. A Parent Laboratory must be an OIE Reference Laboratory for the disease in question or an OIE Collaborating Centre with specialist laboratory expertise to OIE Standards.

Candidate Laboratories should have the real potential to make significant improvements in terms of capacity and expertise. They will need adequate facilities and infrastructure, and the will to improve. The resources for administering the project and for training must be considered at both the Parent and Candidate Laboratory.

The partnership will require effective and reliable communication links between the two laboratories and experts.

The location of the Candidate Laboratory is important. It should be located where transport links are reliable and where there are unlikely to be serious delays in transporting material across its national borders. It is important that diagnostic material and equipment can be transported to and from the laboratory safely and effectively with minimal delay.

If the project is to succeed, goals that are set at the outset must be realistic and attainable.

The selection of Twinning partnerships should be transparent and open.

Roles

The OIE Reference Laboratory (Parent Laboratory)

The Parent OIE Reference Laboratory and the designated expert(s) from that laboratory are the driving force, ensuring the success of the Twinning agreement.

The expert at the Parent Laboratory is the project manager. He/she may decide to nominate a project leader who will be responsible for the activities of the Parent Laboratory.

The Parent Laboratory agrees on the project proposal and work plan with the Candidate Laboratory and submits this to the OIE Central Bureau in Paris.

The Parent Laboratory is responsible for the implementation and use of the financial resources supporting the Twinning project.

Candidate Laboratory

The Candidate Laboratory should be fully committed to improving its capacity and expertise with the eventual aim of reaching OIE standards, in compliance with the Terrestrial or Aquatic Manuals.

Although the Parent Laboratory is the driver of the project, the Candidate Laboratory, being the beneficiary, owns the end result that has been achieved through the partnership.

The expert (or someone he/she nominates) at the Candidate Laboratory is project leader for activities of the Candidate Laboratory.

The OIE

The OIE Central Bureau provides support and coordination for the overall Twinning programme. The Scientific and Technical Department will collate the proposed projects and applications for referral to the Biological Standards Commission or Aquatic Animal Health Standards Commission.

The OIE will make sure that technical and financial controls, outlined in the mutual agreement between the participating laboratories, are applied and comply with the requirement of the donors involved.

The OIE will initiate and facilitate negotiations between the OIE and potential financial donors to further assist Twinning projects.
The Biological Standards Commission or in the case of aquatic animal disease, the Aquatic Animal Health Standards Commission is responsible for reviewing and approving applications for Twinning projects.

The OIE World Fund for Animal Health and Welfare provides financial support for OIE Twinning programme.

Submission of proposals for OIE-supported Twinning

Initial approach and project brief

A Candidate or Parent Laboratory may express interest in taking part in a Twinning project. This initial approach should be accompanied by a ‘project brief’, which may be in the form of an email or letter to the OIE Central Bureau. This is a brief description of the reasons for the project and the benefits that the project will provide. It should summarise the justification or ‘mandate’ for the project. This should also be sent or copied to the Delegate(s) overseeing the laboratory.

If the Candidate Laboratory has a good relationship with a relevant OIE Reference Laboratory or has a particular laboratory that it wishes to twin with then this should be clearly stated. The Parent Laboratory must be an OIE Reference Laboratory or Collaborating Centre with relevant expertise.

In other cases, where a Parent Laboratory has not been indicated by the Candidate Laboratory and the initial interest is supported, the OIE may suggest a suitable Parent Laboratory, depending on the specific request, location, and disease situation.

Following receipt of the project brief, the OIE will advise on further action.

Project proposal

Any Candidate or Parent Laboratory that has the support of the Delegate can submit a project proposal to the OIE following submission of a project brief. The OIE may advise on factors that make it unlikely for the application to be successful; this might include duplication with an existing or proposed Twinning project in the region.

The potential Parent Laboratory should submit the project proposal to the Director General of the OIE.

The Twinning proposal should include:

- An official letter signed by the official OIE Delegates of the Member Countries or Territories and Directors of both institutes.

- The details of the Delegates, laboratories and the responsible experts at the Parent and Candidate Laboratories. If the responsible expert leaves or is replaced, the OIE needs to be informed of this and agree to the change.

- Curriculum Vitae of the experts at the Parent and Candidate Laboratory.

- A project plan (including timetable and all the points covered in Annex 2).

- A budget proposal (Annex 3).

The application dossier should be submitted in one of the official languages of the OIE (English, French or Spanish). A hard copy and an electronic copy should be sent to the Director General of the OIE.

Consideration of selection criteria guidelines and a statement of clear, measurable and achievable objectives will improve the chances of a successful application.

The budget proposal should be drafted in accordance with the template (Annex 3). There will not be scope for funding expenditure outside of the agreed final budget.

Evaluation of proposal

The proposal will be considered by the Biological Standards Commission or, in the case of aquatic animal diseases, the Aquatic Animal Health Standards Commission. In certain circumstances where the OIE agrees that there is an urgent need to approve a Twinning project, the procedure may be ‘fast-tracked’. In such cases this will involve referral to the elected President of the Biological Standards Commission or, in the case of aquatic animal diseases, the President of the Aquatic Animal Health Standards Commission.

To cater for the variable nature of Twinning projects, the evaluation process will consider each application on a case-by-case basis.

Feedback following evaluation and project initiation

The OIE will consider each proposal and respond by accepting the proposal, seeking further clarification or rejecting the proposal. In the case of the latter, the OIE may give a reason for the failed application.
If the proposal is accepted then the project should be initiated without undue delay.

**Project plan**

The project plan describes what the project objectives are exactly and how they will be met, at what cost, when and by whom. It houses the details of the project and will be a reference point throughout the project.

The plan should emphasise the key areas of work where improvements will have a significant impact on the overall benefits of the project.

The project should be divided into stages with defined measurable outputs from each stage. Examples may include the completion of a workshop or the attainment of a certain level of competence in a laboratory procedure. At the end of each stage it is important to hold a review to assess project progress and address any outstanding issues. This would include checking that targets have been met, assessing budgetary expenditure, considering project risks and planning for the next stage. Any lessons that have been learned should be used to improve the project. For future reference, it is important to summarise the review in a brief written report.

In some cases changes will need to be made to the plan as priorities shift or as project issues arise. Examples may include the validation of a new technology or procedure (e.g. a better laboratory test) not accounted for in the project plan, developments in the disease situation, or changes to the political, commercial or legislative environment. The project plan is a dynamic document and needs to be continually updated. Any changes to the project plan should not take expenditure outside the project budget.

Significant changes to the project plan, affecting the overall project or budget, should be submitted to the OIE for approval before being adopted.

An outline of what the project plan should include is shown in Annex 2.

**Exception report**

If a serious ‘exceptional’ issue is encountered that affects the overall project or budget, the OIE should be notified immediately by way of an ‘exception’ or ‘deviation’ report. The report should provide a full description of the problem and identify recommended actions.

An example might be a dramatic increase in sample shipping costs.

The OIE will consider the report and communicate on further action.

**Budget request**

A budget for the project is agreed between OIE and the Twinning participants. An initial draft budget is jointly submitted by the Parent Laboratory and Candidate Laboratory as part of the project proposal. It must reflect the subjects and activities outlined in the project plan.

The budget should fit the template in Annex 3 and should be subdivided into **subjects** and **activities**. A subject is a general item (e.g. training) whereas an activity is more specific (e.g. a workshop); each activity forms a budget line. An activity should be an isolated cost, i.e. separate and not linked to any other costs in the budget plan.

The budget should be in the currency of the Candidate Laboratory country.

Following review of the draft budget by the OIE, it will be accepted, returned with comments or rejected. If it is accepted, the draft becomes the final version. If it is returned with comments, the Parent Laboratory has the opportunity to consider and submit a revised version.

A budget will only be allocated to activities for which financing is requested and where those activities are eligible for funding.

The following are examples of eligible costs:

- Travel costs and per diem for experts visiting the Parent or Candidate Laboratory to participate in activities directly related to the Twinning project. Travel costs, including per diem, must be in line with current OIE rules (contact OIE for guidance).

- The costs of laboratory reagents that are directly linked to the Twinning project. This includes reagents used for practical training activities, assessments, and ring trials.

- Shipping of diagnostic material directly related to the Twinning project.

- Training activities and material such as stationery specifically for seminars, **excluding** certain items such as printers, IT equipment, paper, ink for printers. Details of the training activity and specific costs must be submitted.
It is not an objective of Twinning projects to directly provide funds to equip laboratories with hardware or building materials. However, a Twinning project may include an assessment of the laboratory’s needs for additional hardware.

The OIE will provide guidance and advice for participants wishing to make an application for Twinning. However there will not be financial support for the preparation of proposals.

**OIE laboratory Twinning without OIE financial support**

Some laboratories may wish to apply for OIE Laboratory Twinning without making a request for financial support from the OIE; for example they may receive funds from their own country. In such cases a budget does not need to be submitted. However the project should comply with all other aspects of OIE Laboratory Twinning, in particular monitoring of outputs and performance.

**Assessment of laboratory material needs**

During the Twinning project, the Parent Laboratory may make an assessment of the material needs of the Candidate Laboratory. This will take into account the expertise at the Candidate Laboratory, the level of expertise required to use the equipment and the capability to maintain and run the equipment.

Funding for purchase of laboratory hardware will not be provided by the OIE Twinning budget. However, an assessment of material needs may help the Candidate Laboratory to source other external funding or use existing funds to maximum benefit.

**Guidance for training**

Training will be an inherent part of the Twinning project and must contribute to the overall objectives of the project. The nature of training activities may include day-to-day communication on specific issues, sharing of scientific communications, comments on draft papers, short secondments between laboratories, participation in technical meetings and conferences, and structured workshops. Training should focus on developing self reliance in the Candidate Laboratory.

Training activities should be regularly evaluated to assess that the objectives are being met so that improvements can be made, when necessary.

When planning a workshop it is important that participants are chosen for their experience and expertise or are chosen from a specific related area of work. Learning material must be relevant. The objectives of the training activity should be clearly defined at the outset so that suitable participants can be selected. In deciding on suitability of participants, it may help to review an applicant’s CV or a brief biography.

**Links between staff**

To maximise the benefits and to avoid the risk of knowledge gaps, it is important that strong links are formed between staff of the Parent and Candidate Laboratory at every level. Whilst the experts are involved with high level expertise and management, other laboratory staff, researchers and technicians have hands-on, day-to-day experience in essential technical and practical activities. Knowledge will be shared more effectively through direct links between people.

**Flexibility**

The approach to training and the training material should take into account factors such as the language spoken in the laboratory, cultural issues, technological capability and budget. Some of these will be limiting factors and will need to be considered in the early planning stages of the project.

**Training trainers**

It is important that people are trained in a way that allows them to disseminate expertise to their colleagues and to stimulate debate in their own region. This involves selecting suitable attendees with good communication skills who are in a position to pass on their knowledge. The training activities should take this into consideration, when relevant, by incorporating teaching skills into the work programme and sharing training material suitable for wider dissemination.

**Assessment**

It is essential to assess that training is meeting the expectations of the participants. This may be achieved through a pre- and post-training questionnaire that allows suggestions about how training could be improved. Accurate and useful feedback is more likely when questions are carefully considered and participants have the opportunity for anonymity and are provided with a set convenient time to complete the questionnaire. This should be done as close to the training as possible or during the training period.
To assess whether training is having the desired effect it may be helpful to evaluate the level of competence of those being trained. This assessment may be informal.

**Secondments**

During a secondment, a member of staff at either laboratory spends time at the other laboratory on detached duty. Examples include for 'hands on' training or for the assessment of material needs and working practices in the Candidate Laboratory. Secondments that are part of the Twinning project must have direct benefits for the Twinning project.

Secondments should be well planned. Specific needs should be discussed in advance of the secondment period to allow a plan to be constructed and, if necessary, materials to be sourced. The maximum length of a secondment supported by OIE is usually 3 months, with the possibility to repeat this once.

**Monitoring**

Monitoring is essential to ensure that the project remains within its scope, realises its benefits and uses its financial resources effectively.

**Monitoring performance**

To ensure that the project achieves its objectives in the set period it is important to regularly monitor progress and take corrective action when necessary. Underperformance needs to be identified as early as possible to minimise the impact on the project. Performance should be monitored by the achievement of predefined set goals within the project timeframe.

To facilitate monitoring, the project plan can be divided into stages; at the end of each stage a product is delivered. Examples of a product or output may include completion of a workshop, publication of a training manual, or attainment of a certain level of competence in a diagnostic procedure. These should be set to a timetable.

At the end of each stage a review should take place led by the expert (or someone he/she nominates) at the Parent Laboratory; this can be brief and informal. The review provides the opportunity to 'take stock', summarise the achievements of the previous stage, and, if targets haven't been met, to understand why so that action can be taken. It is a good idea to document this and it is important to reflect any necessary changes in the project plan.

**Monitoring expenditure**

Actual spending should be documented regularly throughout the project (see ‘verification of expenditure’).

**Project risks**

It is important to be realistic and have an awareness of factors that may hamper project progress and increase project costs. These risks may be present from the beginning of the project or arise after it has started.

Every Twinning project is likely to encounter project risks. An awareness of potential project risks is the first step to avoiding them.

Before starting and during the project it is important to:

- Identify project risks;
- Consider the impact that they may have on the project if they occur;
- Consider how likely they are to occur;
- Consider what action can be taken to minimise their impact.
- Document tentative contingency plans to be used should an identified risk occur.

An example of a project risk may be the occurrence of a disease outbreak in the country of the Parent Laboratory, which would require prioritisation of resources for controlling the outbreak. This could have a big impact on the project if it were to occur before a training workshop or if the outbreak were prolonged. The likelihood of this occurring may be difficult to predict, or in some cases it may be easier to predict where reoccurrences of disease are frequent or if the disease occurs seasonally. Action may include planning alternative training arrangements or scheduling training for times when outbreaks are less likely to occur.

The above example of a project risk has potential benefits in terms of training. It might provide the opportunity for the Candidate Laboratory to gain experience in scaling-up diagnostic capacity and working in the face of a disease outbreak. The point is that the risk should be considered before it occurs. In this example when an outbreak occurs, there may not be time to plan who should visit from the Candidate Laboratory, for how long and what activities they will participate in. However with prior consideration and planning, the secondment may be relatively straightforward to arrange at short notice.
Other risks that need to be considered may include political factors, such as the frequent replacement of the Chief Veterinary Office or Chief Executive of the laboratory concerned.

Many, but not all risks can be identified prior to starting the project. It is important to regularly monitor risks and evaluate them as they arise. A convenient time to do this is at the end of each defined stage of the project.

If a risk becomes an issue that may affect the whole project or budget then the OIE must be notified immediately (see Exception report).

**Reporting requirements**

As a minimum the Parent Laboratory should – after agreement with the Candidate Laboratory – submit the following reports to the OIE Scientific and Technical Department in the OIE Central Bureau, Paris. These should be typed in one of the official languages of the OIE (English, French or Spanish).

- An *interim report*, within the first year, but at least 4 months after the project has started – a brief summary reflecting project progress following initiation and expenditures to date.

- *Annual reports*, within 1 month of the end of each year from the project start date.

- A *final report*, as soon as possible on completion of the project. The final reports should be jointly prepared by the Parent and Candidate Laboratory, co signed and submitted to the OIE Central Bureau. The final report should include the items listed in Annex 4.

- Post-project review, 6–12 months after project closure.

Annual and final reports must include details of actual expenditure.

In addition to these reports it is recommended that end-stage reports are documented.

**Financing arrangements and payments**

Funds will be transferred to and managed by the Parent Laboratory; payments will be made when the project is initiated, following an interim report/request, and after receipt of each annual report and a final report. The size of the payments, as a proportion of the total budget, will be calculated on a case-by-case basis. As a general rule approximately 50% of the total budget will be transferred to the Parent Laboratory when the project is initiated. The remaining budget will be transferred to the Parent Laboratory over the course of the project, following receipt of interim, annual and final reports.

Any budget that remains unspent at the close of the project must be refunded to the OIE.

**Verification of expenditure**

It is important that financial expenditure complies with the project plan, budget and eligibility rules.

In certain circumstances the OIE may require that a post-project audit is carried out. Therefore, all financial records and detailed accounts, including evidence of expenditure (receipts etc.) must be kept available for at least 5 years after the project has closed.

The OIE may request verification of expenditure at any point during the project. It is very important that financial records are kept up to date and that receipts of expenditure are available for a random exceptional audit.

Any audit (exceptional or post-project) will be carried out by authorised OIE staff or an independent financial expert appointed by the OIE or by a Donor in agreement with the OIE.

**Premature termination of the project**

In the unlikely event that the project needs to be terminated prematurely, the OIE, Candidate or Parent Laboratory may initiate this by providing 3 months notice to the other parties, in writing.

In the event of premature termination, payments for costs actually incurred or indissolubly committed up to and including the date of termination will be reimbursed by the OIE. No payments other than these will be due to the Parent or Candidate Laboratory.

**Project closure**

The Parent Laboratory should immediately inform the OIE in writing that the project has closed. Within 1 month of this date, the Parent Laboratory should submit a final report jointly prepared with the Candidate Laboratory.

The final project report will be the most comprehensive of all reports submitted over the course of the project and should include all the information listed in Annex 4.
Post-project review

The post-project review takes place 6–12 months after the project has closed. This is important because it will identify whether the benefits of the project have been achieved and whether any unexpected problems have arisen. It provides the opportunity to assess the medium- to long-term benefits of the project.

The post-project review will involve input from both laboratories and a report will be circulated to the OIE. A representative from the OIE may attend the post-project review.
Annexes

Annex 1: Mandatory documents

- Project proposal dossier – including:
  - Official letter signed by Delegates of both OIE Members and Directors of both institutes
  - Details of the experts (including their CVs) and laboratories
  - Project plan
  - Budget proposal

- Project reports – as a minimum:
  - An interim project report
  - Annual project reports
  - A final project report
  - Post-project review
  - Notification of project closure

Annex 2: The Project Plan

The project plan should include the following:

- Details of the two Delegates whose laboratories will be participating and the Directors of the two laboratories.

- The names and addresses of the two institutes.

- Names and contact details (address, telephone, email and Fax) for the expert taking responsibility for the project at the Parent Laboratory and the expert taking responsibility at the Candidate Laboratory. In addition to the expert at the Parent Laboratory, if a project leader has been nominated, they also should be identified.

- Name(s) of the disease(s) and topic(s) that will be covered by the Twinning project.

- Proposed start date and length of the project.

- A short and concise summary of the objectives.

- Detailed description of how each objective will be met.

- A work plan showing who is involved in which task, including administration and budget management.

- A training plan.

- Time tables and measurable outputs (targets) for each stage.

- Any foreseeable risks to the project.

- A communication plan – including laboratory to laboratory, laboratory to OIE, frequency of project updates/end stage reviews.

- Provisions for shipment of samples in accordance with the requirements for postage and packaging of biological materials described in chapter 1.4.5. of the OIE Terrestrial Animal Health Code

- A budget broken down into specific subjects and activities (see template at Annex 3 for guidance).
Annex 3: Budget proposal for an OIE Laboratory Twinning

- **Recipient**: (laboratory A)
- **Animal Disease**: (name of disease)
- **Currency**: (specify)
- **Application**: (name)
- **Prepared by**: (contact details)

## Budget Proposal for an OIE Laboratory twinning between

(name of laboratory A), (name of country A)

and

(name of laboratory B), (name of country B)

Annex 4: The final project report

The final report must be submitted within 1 month of the project closing. It should be jointly prepared, and signed, by the Parent and Candidate Laboratories then submitted to the OIE Scientific and Technical Department by the Parent Laboratory.

The final project report should cover the following:

- Summary of the project aims and objectives set out at the start, including the justification for the project.
- Description of situation in Candidate Laboratory at the beginning of the project and the priority areas that were selected for improvement.
- Any changes that were made to the initial project plan, such as a change in direction or scope.
- Description of activities including training, secondments, workshops, joint research and publications, sharing of diagnostic material, assessments, project reviews.
- Situation in Candidate Laboratory at the end of the project including the ability to maintain and sustain the achieved objectives.
- A final report of expenditure.
- Lessons learned to improve future projects.
- Recommendations for future projects.
- Mid- to long-term strategy for the Candidate Laboratory and sustaining the link between the two laboratories.

Annex 5: Timeline for Twinning projects

1. Expression of interest by Candidate Laboratory; email or letter with brief description and justification for Twinning project.
2. Comments from the OIE on further action.
3. Submission of formal application dossier to the OIE in response to initial interest.
4. Project initiation.
5. Length of project up to an initial estimated period of 3 years.
6. Interim and annual project reports. The frequency of project reports will be described in the project plan. Ideally there will be a brief written report at the end of each project stage.

As a minimum there must be an interim report in the first year, at least 4 months after the project has been initiated, there should be an annual reports, a final report and a post-project review.

7. Project closure, immediate notification to OIE.
8. Final project report within 1 month of project closure.
9. Post-project review 6–12 months after project closure.
